Experiment 1: Traditional Crypto Methods and Key Exchange

1   OBJECTIVE

This experiment will be in two parts:

1) To implement Substitution, ROT 13, Transposition, Double Transposition, and Vernam Cipher in Scilab/C/Python/R. 2) Implement Diffie Hellman key exchange algorithm in Scilab/C/Python/R.

2. INTROUCTION TO CRYTO AND RELEVANT ALGORITHMS

Cryptography:
In cryptography, encryption is the process of transforming information (referred toas plaintext) using an algorithm (called cipher) to make it unreadable to anyone except thosepossessing special knowledge, usually referred to as a key. The result of the processis encrypted information (in cryptography, referred to as cipher text). In many contexts, theword encryption also implicitly refers to the reverse process, decryption (e.g. "software for encryption" can typically also perform decryption), to make the encrypted informationreadable again (i.e. to make it unencrypted). Encryption is used to protect data in transit, for example data being transferred via networks (e.g.the Internet, e-commerce), mobile telephones, wireless microphones, wireless intercom systems, Bluetooth devices and bank automatic teller machines. There have been numerous reports of data in transit being intercepted in recent years/ Encrypting data in transit also helps to secure it as it is often difficult to physically secure all access to networks

Substitution Technique:
In cryptography, a substitution cipher is a method of encryption by which units of plaintext are replaced with ciphertext according to a regular system; the "units" may be single letters (the most common), pairs of letters, triplets of letters, mixtures of the above, and so forth. The receiver deciphers the text by performing an inverse substitution.

There are a number of different types of substitution cipher. If the cipher operates on single letters, it is termed a simple substitution cipher; a cipher that operates on larger groups of letters is termed polygraphic. A monoalphabetic cipher uses fixed substitution over the entire message, whereas a polyalphabetic cipher uses a number of substitutions at different times in the message, where a unit from the plaintext is mapped to one of several possibilities in the ciphertext and vice-versa.

Transposition Technique:
In cryptography, a transposition cipher is a method of encryption by which the positions held by units of plaintext (which are commonly characters or groups of characters) are shifted according to a regular system, so that the ciphertext constitutes a permutation of the plaintext. That is, the order of the units is changed. Mathematically a bijective function is used on the characters' positions to encrypt and aninverse function to decrypt.

In a columnar transposition, the message is written out in rows of a fixed length, and then read out again column by column, and the columns are chosen in some scrambled order. Both the width of the rows and the permutation of the columns are usually defined by a keyword. For example, the word ZEBRAS is of length 6 (so the rows are of length 6), and thepermutation is defined by the alphabetical order of the letters in the keyword. In this case, theorder would be "6 3 2 4 1 5".

In a regular columnar transposition cipher, any spare spaces are filled with nulls; in anirregular columnar transposition cipher, the spaces are left blank. Finally, the message is readoff in columns, in the order specified by the keyword.

Double Transposition:
A single columnar transposition could be attacked by guessing possible columnlengths, writing the message out in its columns (but in the wrong order, as the key is not yetknown), and then looking for possible anagrams. Thus to make it stronger, a doubletransposition was often used. This is simply a columnar transposition applied twice. The samekey can be used for both transpositions, or two different keys can be used.
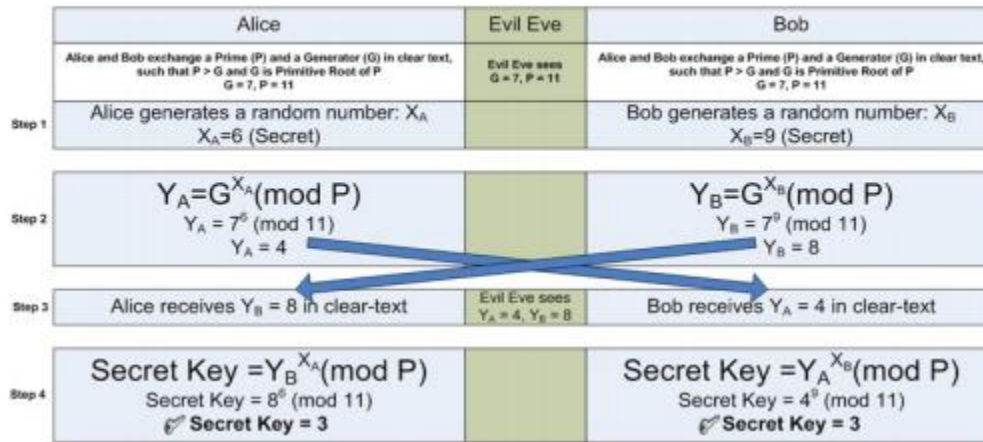

Vernam cipher:
In modern terminology, a Vernam cipher is a symmetrical stream cipher in which theplaintext is XORed with a random or pseudorandomstream of data (the "keystream") of thesame length to generate the ciphertext. If the keystream is truly random and used only once,this is effectively a one-time pad. Substituting pseudorandom data generated bya cryptographically secure pseudo-random number generator is a common and effectiveconstruction for a stream cipher.

Diffie –Hellman Key exchange algorithm:
The Diffie–Hellman key exchange method allows two parties that have no prior knowledge of each other to jointly establish a shared secret key over an insecure communications channel. This key can then be used to encrypt subsequent communications using a symmetric key cipher. Although Diffie–Hellman key agreement itself is an anonymous (non-authenticated) key-agreement protocol, it provides the basis for a variety of authenticated protocols, and is used to provide perfect forward secrecy in Transport Layer Security's ephemeral modes (referred to as EDH or DHE depending on the cipher suite).

Diffie Hellman Key Exchange

Alice	Evil Eve	Bob
Alice and Bob exchange a Prime (P) and a Generator (G) in clear text, such that P > G and G is Primitive Root of P G = 7, P = 11	Evil Eve sees G = 7, P = 11	Alice and Bob exchange a Prime (P) and a Generator (G) in clear text, such that P > G and G is Primitive Root of P G = 7, P = 11

Step 1 — Alice generates a random number: X_A X_A=6 (Secret) | | Bob generates a random number: X_B X_B=9 (Secret)

Step 2 — $Y_A = G^{X_A}(\bmod\ P)$ $Y_A = 7^6 (\bmod\ 11)$ $Y_A = 4$ | | $Y_B = G^{X_B}(\bmod\ P)$ $Y_B = 7^9 (\bmod\ 11)$ $Y_B = 8$

Step 3 — Alice receives $Y_B = 8$ in clear-text | Evil Eve sees $Y_A = 4, Y_B = 8$ | Bob receives $Y_A = 4$ in clear-text

Step 4 — Secret Key $= Y_B{}^{X_A}(\bmod\ P)$ Secret Key $= 8^6 (\bmod\ 11)$ ✍ Secret Key = 3 | | Secret Key $= Y_A{}^{X_B}(\bmod\ P)$ Secret Key $= 4^9 (\bmod\ 11)$ ✍ Secret Key = 3

3   LAB TASKS

Write a single program which fits all algorithms. YOU should generate output in following manner:

1. Select the Cryptography Method Provide Choice 1…5 for subjected crypto methods
   a. Substitution
      i. Your choice
      ii. Enter Plain text to be encrypted
      iii. Enter the no. of Position shift
      iv. Encrypted Message
      v. Decrypted Message
   b. ROT 13
      i. Your choice
      ii. Enter Plain text to be encrypted
      iii. Encrypted Message
      iv. Decrypted Message
   c. Transpose
      i. Your choice
      ii. Enter Plain text to be encrypted
      iii. Encrypted Message
      iv. Decrypted Message
   d. Double Transposition
      i. Your choice
      ii. Enter Plain text to be encrypted
      iii. Encrypted Message
      iv. Decrypted Message
   e. Vernam Cipher
      i. Your choice
      ii. Enter Plain text to be encrypted
      iii. Input Key
      iv. Encrypted Message

          v.   Decrypted Message

      f. Diffie Hellman

          i. Enter the Prime Number g:

          ii. Enter second Prime Number n:

          iii. Enter the Secret x:

          iv. Enter the Secret y

          v. K1:

          vi. K2:

CODE:

```python

OUTPUT:

a. **Substitution**

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
1
Enter the plain text to be encrypted:
Hello World
Enter the no. of Position shift:
5
Encrypted message is : MjqqtBtwqi
Decrypted message is : HelloWorld
```

b. **ROT 13**

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
2
Enter the plain text to be encrypted:
Hello World
Encrypted message is : UryybJbeyq
Decrypted message is : HelloWorld
```

c. Transpose

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
3
Enter the plain text to be encrypted:
Hello World
Enter the input key :
HACK
Encrypted Message is: e llWdHorlo_
Decrypted Message is: Hello World
```

d. Double transposition

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
4
Enter the plain text to be encrypted:
Hello World
Enter the input key :
HACK
Encrypted Message after double transposition is:  dllHoeWrlo_
Decrypted Message after double transposition is: Hello World
```

e. Vernam Cipher

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
5
Enter the plain text to be encrypted:
Hello World
Enter the input key :
Olleh dlrow
Encrypted message is : JPAPJAVFAFV
Decrypted message is : HELLO WORLD
```

f. Diffie Hellman

```
Choose the algorithm to encrypt and decrypt your text:
1.Substition
2.ROT 13
3.Transpose
4.Double transposition
5.Vernam Cipher
6.Diffie Hellman
6
Enter the prime number:
23
Enter the second prime number:
7
Enter the first secret key:
4
Enter the second secret key:
3
First secret key received K1 is : 16
Second secret key received K2 is : 16
```

OBSERVATIONS:
- Caeser cipher is the simplest substitution cipher by Julius Caesar. In this substitution technique, to encrypt the plain text, each alphabet of the plain text is shifted by the 'key' places . And to decrypt the cipher text each alphabet of cipher text is shifted by the alphabet 'key' places before it.
- ROT13 cipher(read as – "rotate by 13 places") is a special case of the Ceaser cipher in which the shift is always 13.So every letter is shifted 13 places to encrypt or to decrypt the message.
- In Transposition Cipher Null values i.e hiphen to be added at the end of plain text to fill the matrix. Length of the cipher message is a multiple of length of a key so it may be greater than length of plain text.
- Double transposition is a very strong encryption method.
- In Vernam cipher algorithm, we take a key to encrypt the plain text which length should be equal to the length of the plain text.

- The Diffie–Hellman key exchange method allows two parties that have no prior knowledge of each other to jointly establish a shared secret key over an insecure communications channel.

CONCLUSION:

- Thus I understood implementation of various encrypting and decrypting techniques of a message in python.
